Dear Readers,

Never before has the economic apparatus tested its proenergy. The digitalization of mobility processes promocesses for environmental compatibility as comprehentes business models and can thus create environmensively as is currently the case. Almost every day we tal solutions. The proof has already been provided in produce innovations that help us to move forward as real laboratories all over the world: it is feasible and the humanity and to improve what already exists. In the amortization period for the necessary investments is meantime, many products and solutions have reached manageable. market maturity and give us hope

for a future that reconciles climate and environmental protection, cost-effectiveness, a fossil-free green economy, social justice, jobs, circular economy, value creation, and prosperity.

The key to **success** lies in new partnerships, in leaving old paths.

In these processes, we are particularly interested in the overall economic context and how we manage to present a proof of concept. Because that is the only way to shape our world as we imagine it for us and our children in the near future. By the middle of the century at the latest, mankind should no longer pollute the climate. Greenhouse gas emissions then have to be avoided as far as possible.

For the reasons mentioned above, we should work toon, we are fortunate to have the resources needed to accomplish this transformation. The only thing we don't gether and transnationally to strengthen the green economy and continue to advance an ambitious, rahave enough of is time. Therefore, we should never lose pid energy and mobility transition at all levels in polisight of the factors of time and action and always give tics, business, and industry. To do this, we need inforpriority to the long-term perspective, even in the face of med and enlightened actors who are able to recognize acute problems. their options for action and who can thus develop an industrial policy steering effect. At the levels of technolo-I think we're the last, or at most the penultimate, genegy, knowledge, insight and finance, we are able to exration that can still do it. In any case, it is clear that it is pand our profitability analysis to include a number of our responsibility to start the processes or to acceleraaspects and to make them increasingly post-fossil, clete them as much as possible. With this in mind, I wish us an, quiet, energy- and resource-efficient as well as fair all every success with a guote from Johann Wolfgang and socially compatible. In professional circles this means: interoperable sys-**Christian Heep** tems. Energy with traffic, traffic with data, data with **Board Member**

The key to success lies in new partnerships, in leaving old paths. Electromobility sets the example for the creation of new connections: charging electrical energy instead of filling up with petrol and diesel, sharing instead of

owning, digital instead of analogue, regionally available energy instead of fuel imports, resource efficiency through retrofitting instead of scrapping and much more.

Despite the many global crises that are currently hitting us painfully and are responsible for some setbacks, but at the same time are enormously accelerating the pressure to act, the general spirit of the times and the willingness of those involved tend to look good. In additi-

The German Federal Association for eMobility (Bundesverband eMobilität / BEM) connects all the stakeholders from science and research, economy, politics, and media, promotes the public visibility for emobility through numerous events and inserts for necessary changes in the infrastructure.

We are **building networks** between political, economic and scientific stakeholders.

It is also a task of the BEM to improve the regulatory framework for the rollout of electric mobility as an important and pioneering mobility concept and the implementation of equal opportunities for the change to eMobility.

The branch of eMobility will be a strong growth market not only when it comes to preserve jobs and create new jobs. It is necessary to confront the challenges of the new mobility

together to save a sustainable upsurge in the whole market. These assignments urge active participation of the most innovative enterprises, strong personalities, and the cooperative collaborating of all stakeholders from science, research, economy, politics, media, the associations, and institutions, as well as the engagement of every citizen who likes to engage for the new mobility.

A BEM membership combines the social, economical, and ecological challenges with the opportunities of electric mobility and sustainable developments and establishes those in society.

OBJECTIVES

Represent BEM member companies and their interests internationally. Spread and position the concept of a sustainable New Mobility.

Open up new business opportunities / markets for member companies.

Broaden the association's portfolio, to strengthen internationalization and media presence.

WORKING GROUPS 80-90% OF THE RELEVANT MARKET PLAYERS IN GERMANY / EUROPE

With the growing importance of electromobility, the need for professional exchange has grown. The association currently has 19 working groups that regularly deal with the various aspects of eMobility. These include questions of charging infrastructure, grid suitability, battery, retrofitting, maritime eMobility, safety and security, green fleet, law, off-highway, big data, blockchain, etc.

Members of the German Federal Association for eMobility

The involvement of our members and partners in the different BEM events, exhibitions, publications, and projects on the national and international stage is, therefore, one of our most important tasks on a daily business. Moreover, we take care that our members get optimally connected to develop new cooperations and business models for a prompt, visible new mobility.
